Hazard Assessment and Control: a handbook for Alberta employers and workers

Fall protection plan

Information sheet for residential roofing

This bulletin provides an overview of fall protection planning for Alberta employers, prime contractors and workers working in residential roofing.

Elimination of a hazard is the best way of controlling the hazard. Examples of ways to eliminate fall hazards include installing guardrails, building a roof on the ground and lifting it into place, etc.

KEY INFORMATION

A fall protection plan must include:

- the potential fall hazards to the worker,
- the fall protection system being used,
- appropriate anchors to be used,
- the clearance distance below work area.

Clearance

Clearance distances below the work area must be enough to prevent a worker from striking the ground or an object or level below the work area upon full deployment of a fall arrest system.

- Clearance distances are based on the type of fall protection equipment used and the anchor
